SPECIAL REPORT

Utawa meeting on controversial illness is loade

Stories by PAUL BENEDETT
The Speciator

Test people wal 1, 2011.

The Canadian Society for Allergy and Clinical Immunology says a doesn't exist.

Ditto four major North American medical

associations and committees.

The vast majority of scientists and physicians agree the patients are sick, but not from sensitivity to chemicals.

They don't think 20th Century Disease, which is also known by several names including Multiple Chemical Sensitivity (MCS), is

So why is the overwhelming majority of the nine speakers invited by the federal government to a meeting on Multiple Chemical Sensitivity proponents of the dis-

Why are at least three of these people clinical ecologists — doctors who practice "anvironmental medicine" using unproven and largely unaccepted diagnosis and treatment

methods?

And why are at least four of these panel members people who believe they have MCS, themselves, including one doctor who has become a spokesman for the Canadian environmental scholing patient lobby group?

The answers are important because the

WHO IS ON THE PANE

THE PANEL invited to speak at the federal meeting on Multiple Chemical Sensitivity consists of:

Dr. Iris Bell, author of Clinical Ecology: A New Medical Approach To Environmental fliness. She has been an associate fellow of the Society for Glinical Ecology since 1974 and a clinical member since 1980.

Dr. Gerald Ross is the director of the Environmental Medicine Clinic at Victoria General Hospital in Hallfax. He believes he has MCS and wrote about his experiences and the syndrome in a three-part Medical Post series in 1989. He now conducts clinical ecology research in Texas.

Dr. Nichelas Ashferd is an associate profes-

sor of technology and policy at the Massachusetts insurer of fechnology.

Dr. Claudia Miller is an assistant professor of allergy and immunology at the
University of Texas Health Centre in San
Antonio. Along with Dr. Ashford, she is author of Chemical Exposures: Low Levels And High Stakes, a book supportive of the diagnosis of MSC.

Or. Lynn Marshall, an Ottawa doctor who low works in Toronto, believes she suffers from the syndrome and treats MCS patients. She is a member of the American Academy of Environmental Medicine, an American association of physicians practising "environmental medicine."

Br. Roy Fox, the former director of the Centre for Fleatth Care of the Elderly at Camp Hill Medical Centre in Nova Scotia. Now retired after being diagnosed with environmental disease, he has become a spokesman for the Allergy and Environmental Health Association, a group consecuting MCS national interests. epresenting MCS patient interests.

Dr. Eric Nisbett-Brown, clinical immunolo-gist and head of immunology at Toronto General Hospital. He does research in the field and works with MCS patients, and while skeptical about many techniques used by clinical ecologists, he believes environmental illness "almost certainly

health care system being indundated with claims for compensation, disability and treatment by MCS patients.

And that, say doctors, could cost health insurance, workers compensation boards, unemployment insurance and disability plans many millions of dollars.

But advocates across North America are fighting for recognition of the disease and

fighting for recognition of the disease and coverage under government and private insur-ance plans. In Ontario, OHIP will not cover MCS treatments and Workers Compensation does not recognize it as a compensatory

Major medical bodies such as the Canadian Psychiatric Association and the Canadian Society of Allergy and Immunology do not support the theory, practice and treatments of clinical ecology. This month a Nova Scotia government appointed committee on envis government-appointed committee on envi-ronmental illness announced it could "find no evidence to support" the existence of the

Yet the panel assembled by Health and Yet the panel assembled by Health and Welfare includes six advocates who practice clinical ecology or have published articles or books in support of the MCS argument. "It surprises me that the federal government would sponsor such a biased, one-sided panel," said Dr. Kempton Hayes, chairman of a Nova Scotia provincial government committee

government committee examined which Environmental

Hypersensitivity

Other doctors agree.

"There appears to be a political agenda to have a program of people who are in support of the diagnosis," says Dr. Susan Abbey, a Toronto psychiatrist who was invited to the meeting.
"I think the government "I think the government should be providing leadership and convene a meeting with people who have
open minds."

what they saw as an imbalance of views say they were given the brushtives of key medical bodies who contacted Ms Gowanlock about.

Dr. Bill Moote, president of the Canadian Society of Allergy and Clinical Immunology said his association will have someone attend the meeting. "We don't have any option other than going and being a thorn in their side, and refusing to let silliness be stated as fact... They really don't have any business setting up a workshop with that much bias."

Dr. Moote said the Society was invited to attend the meeting but not to provide a speaker. He asked the organizers to be allowed to present a 10-minute talk on the immuno-

logical implications of MCS.

The answer was no, but Dr. Moote was asked to take part in the scheduled afternoon sessions from which the final report will emerge. "This should not come out as a clinical ecology mouthpiece," he said.

Susan Daglish, executive director of the Allergy Information Association profit national organization that helps people with affergies says she is concerned about

with anergies — says sne is concerned about the "one-sided" nature of the conference. "Why isn't there someone from the main-stream allergy side?," she said. "I wasn't sure I was going to attend because the program was lopsided."

OR. ABBEY SAID THAT when she first received a list of panel members, she was surprised by who was invited and who was

The official title of the conference is: Multiple Chemical Sensitivities And Their Relevance To Psychiatric Disorders. But, says Dr. Abbey, the leading Canadian researcher in the field — Dr. Donna Stewart of Toronto, who published an influential paper called A Psychiatric Assessment Of Patients With 20th Century Disease — was not invited to speak. "She's recognized throughout North America for her work," said Dr. Abbey. There's something very odd going on when the leading Canadian psychiatrist in the area is not invited."

Dr. Abbey, who agrees with the mainstream psychiatric view of MCS, was invited to speak bout chronic fatigue, not MCS. And while other speakers were given 25 minutes for their presentations, she was allotted only 20.

Ms Gowanlock said the shorter allotment was inadvertent. "It wasn't an intentional thing.

Dr. Abbey expressed her concerns to Ms Gowanlock in a detailed and strongly-worded

letter this summer. She wrote:

I applaud the interest of Health and Welfare Canada in conducting a workshop on the relevance of psychiatric disorders to this entity. However, my hope would be that this would involve a serious attempt to explore the scientific data available and to disseminate the proven knowledge about the syndrome. reviewing the program as it now stands there

have been serious deficits. It appears the primary criterion for participation is advocacy, with many of the professionals involved themselves having the syndrome. If there is a desire for this to be more than a political forum for advocacy, I think it is important to include more speak-

ers... who have carefully studied the area in peer reviewed publica tions?

Dr. Abbey then recommended a list of experts in the field. "I realize these names may be problematic to the advocacy groups because these individuals have critically evaluated the syndrome," she wrote in the letter. "Nonetheless, patients and medical professionals need sound advice based on fessionals need sound advice based on scientific work and these professionals have made important contributions to the field.

Dr. Fiedler concurs that other experts should have been invited, and that some such as Dr.

Stewart, were conspicuous by their absence.

Ms Gowanlock took about two months to respond to Dr. Abbey's letter. Her answer was that the panel "had been chosen on the basis of people recommended to us" and that budgetary constraints prevented the addition of any new speakers.

In an interview, Ms Gowanlock would not comment on the letter, but said of Dr. Abbey's recommendations: "We didn't invite them, and it's quite possible they didn't figure into the mix because we weren't aware of their work. It certainly wasn't an oversight on purpose. It may be that there are other meetings to be held."

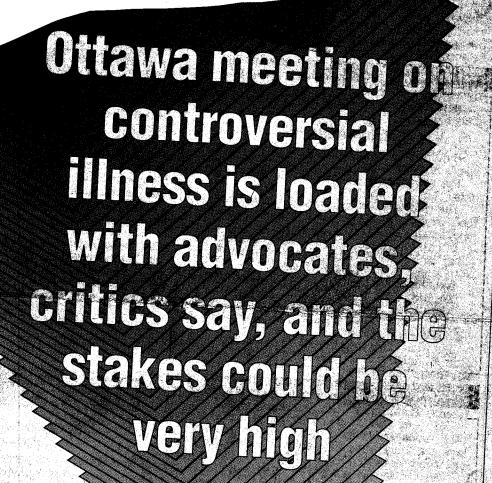

She noted that the "whole front" could not be covered in one meeting. "We went with

what we thought was a balanced group... for a beginning meeting. If we excluded people it wasn't an intentional thing.

Still, many health professionals are concerned that the meeting and its report could affect future health-care policy.

A WORKING PAPER that supports a diag nosis of environmental hypersensitivity could greatly affect patients and care costs, says Dr. Abbey. It has enormous implications at a time when there are so many cost considera-tions," she added.

Dr. Herman Staudenmayer agrees. A Colorado-based scientist who has done extensive research into MCS and published numerous papers on the subject, he says patient advocacy groups and clinical ecologists are lobbying hard in the U.S. and Canada to have the disease recognized. "They're desperately trying to get a government agency to legit imize their argument. Such a move could be an economic disaster," he said. "You are tying into sick building syndrome, multiple chemical sensitivity, and the next thing, elec-

tro-magnetic contamination. If these become legit-imized, you'll see compensation claims that will bankrupt the insurance industry."

Dr. Staudenmayer said anything coming out of the Health and Welfare meeting "is absolute nonsense. The question I would ask is how the hell did this group come together."

Some lobby groups, such as the Allergy and Environmental Health Association of Canada, have called for all patients to be screened for environmental hypersensitivity before any psychiatric examination is considered.

All doctors agree that patients reporting MCS should be treated with respect and compassion, but say acceptance of their diagnosis may not help them recover. Studies by American and Canadian researchers have shown that the majority of patients do not improve with clinical ecology treatment, and many get worse.

treatment, and many get worse.
"My concern is that people with treatable medical and psychiatric conditions might not receive the treatment they need," said Dr. Abbey.
